

Carrot tops

Water Method

You can grow carrots in water. Cut the top from carrot. You'll need about one inch of the root. Stick a toothpick into either side of the carrot stump and balance it on top of a small glass. Use an old juice glass for this since you'll probably end up with mineral stains. Fill the glass with water up to and barely touching the bottom edge of the stump. Set the glass in a light, but not sunny window. Add water to keep it touching the edge and watch the roots sprout. You're growing carrots from carrots in a glass!

Newspaper Method

Alternatively you can use any type of plate and several layers of newspaper for sprouting carrot tops. Lay the newspaper on the bottom of the plate and soak the newspaper well. There should be no standing water. Set your pieces of carrot tops on the papers, and in a few days, you'll see the roots spread. Keep the paper wet. Once the new plants have rooted well, your kids can plant them in soil. The new plants should show growth pretty quickly and your lucky little gardeners will be delighted with their reward.
